Hi,

The last thing needed is myriad devices all independently chatting to the ether.

The only useful outcome is where my personal hub co-ordinates all the IoT devices needs to talk. That way I can set up my own personal preferences, daily routines, security levels, monitoring of my movements, etc using that data to trip the appropriate IoT device to respond.

Leaving it to device manufacturer to set protocols will vastly underplay the benefits of "connected" IoT and will just create internet traffic bedlam.
