Subject: Internet for all in US

Hello,

There has been ample evidence of successful and cost effective ways to bring high speed internet to remote areas....and do it quickly(like now).

The most successful vehicle for delivering reliable and less expensive internet across the world including even planes and ocean going ships (including US NAVY Aircraft carriers!) is SpaceX's Starlink service.

Millions can benefit from this dependable American Company that continues to make its service better over time.

I respectfully ask that Starlink be considered as the MAIN vehicle for providing exceptional broadband service to underserved communities throughout America as it can be done very quickly and very inexpensively!

It would be a very wise use of taxpayer money-it may even save money off the budgeted amount!!

Thank you;
William Hollar
